WEB Technologies 1 (Front End). Final Project

Project brief. This is the release of your website — the version you would put in your portfolio. It remembers its visitor, works on every device and in both light and dark modes, and nothing on it is unfinished.

The same topic, team and GitHub repository as in the Midterm and the Endterm. A new website or a new topic without the instructor's permission gets 0.

Rules for Submission:

1. Every student gets an **individual grade**. If the works of different students or teams are the same, the grade is **0**.
2. Submit before the deadline in the **Final exam** folder of the LMS. **Late works are not accepted!** A late submission gets 0. A student who does not defend receives 0, even if the team submitted.
3. Students whose attendance is below 70% are not permitted to the exam.
4. Every member submits:
   - the project: **Final_FullName1_FullName2….zip**;
   - the report: **Final_FullName1_FullName2….docx** (or .pdf).
5. No commits after the deadline. No downloaded templates. AI tools, icons, photos and code from other sources only **with credit** on the website and in the report. Using them without credit is plagiarism, and the grade is 0.
6. IN THE REPORT MUST BE:
   - Team members and the contribution of each
   - **What is new since the Endterm** and what you fixed after the Endterm defense
   - Screenshots of the new features
   - Credits: what you used and for what
   - **The GitHub repository URL** and **the deployed website link** (e.g., GitHub Pages)

Penalties:

— the website does not open, but the code is submitted: −20%;
— a missing file, a missing link or a missing item of the report: −10% for each;
— wrong file format or name, or not ready when your name is called: −10%;
— commits after the deadline: −20%;
— fewer pages than required (see Size): −20%;
— the student cannot explain their own code (see "Defense and code quality"): −20%.

Requirements and Assessment Criteria

Size: at least 2 pages for 1 student; 4 pages for 2; 5 pages for 3 and 6 pages for 4 on the whole website. New pages are optional. The website must look finished: everything a visitor would expect to work must work (without a backend).

All items are minimum requirements for the pages of every student. Points are lowered for every item that is missing, does not work or looks unfinished. In the Final, the whole website is graded, not only the new parts: the instructor may check any page and any feature.

№	Criterion	What is checked	Points
1	**HTML, CSS and responsive layout (the whole website)**	- semantic HTML (header, nav, main, section, footer); forms and tables where they fit - your own CSS with classes and CSS variables; Flexbox or Grid; your own media queries and the Bootstrap grid and components - every page at 375px, 768px and 1280px in both modes: no horizontal scroll, no overlapping or cut-off elements - opens on GitHub Pages; no broken links, images or 404 pages; one navigation bar on every page with the current page highlighted - alt text for every image; headings in order (h1 → h2 → h3); everything works with the Tab key and has a visible focus	**10**
2	**Light and dark modes**	- a toggle in the navigation bar of every page; works with the keyboard - the chosen mode stays after a reload and on every page (localStorage) - colors are set with CSS variables; both modes are designed: readable text, images, cards, forms and buttons	**10**
3	**Saved user data (localStorage)**	- choose what fits your website: Sign Up / Log In / Profile, or favorites, a cart, bookings, quiz results - accounts: Sign Up stores the data; Log In checks it, shows an error and redirects to the Profile page; the Profile page shows the data; Log Out works; the navigation bar changes for a logged-in user; a note that it is a demo and real passwords must not be used - saved items: added on one page and shown on another page with a counter or a total; kept after a reload; can be removed one by one and cleared - data is saved as JSON; the pages work when localStorage is empty	**12**
4	**JavaScript and forms (the whole website)**	- every form (also Sign Up and Log In) checks the required fields and its rules; errors under the fields, not in alerts; a success message after a correct submit - interactive features built from JavaScript data (arrays of objects) with your own functions, loops, conditions and events; at least one calculated value - handles an empty result and wrong input; no dead buttons, links or forms; no errors in the console	**12**
5	**jQuery effects and animations**	- at least 3 different jQuery effects that help the visitor; hover effects on buttons and cards - smooth in both modes; fast repeated clicks do not break or repeat them	**5**
6	**Design and user experience**	- every page uses the same colors, fonts and spacing as the rest of the website; no default Bootstrap look - every state is designed: hover, focus, error, success, empty result - real content: no “lorem ipsum” and no placeholder images; no dead buttons, links or forms - at least one memorable solution that makes the website stand out	**9**

№	Criterion	What is checked	Points
7	**Improvements since the Endterm and teamwork**	- every remark from the Endterm defense is fixed - visible new work on the pages of the student, listed in the report - the commit history shows regular commits by the student after the Endterm, not one commit at the end - in a team: every member made an equal contribution (a comparable part of the website and their own commits); the pages of all members look and work as one website	**7**
8	**Report**	- the report shows what was done, with screenshots as evidence, and the credits	**5**
9	**Defense and code quality (individual)**	- presents the website (in a team, their own part) clearly, confidently and within the time, without reading from notes and without searching for pages or files - the code is organized: clear folders (css, js, images), separate JavaScript files, meaningful names, no messy, copied or unused code; no errors in the W3C validator - explains the requested features or parts of the code in their own words and answers the instructor's questions with reasons: why this solution, how to find a bug (DevTools, console), how the data is stored	**30**
Total			**100**

Defense (2 minutes per student)

Every student defends individually; in a team, each member presents their own part.

1. **Presentation (1.5 minutes):** the idea of the website in one sentence, then the whole website working live: both modes, the saved user data, the forms and the JavaScript features, the mobile view.
2. **Questions (30 seconds):** Open the code, explain how the requested features or parts of the code work, and answer the instructor's questions.

Have the website and VS Code open before your turn. The instructor may also check any page or feature that was not shown.

Good luck!
