WEB Technologies 1 (Front End). Endterm Project

Project brief. Your Midterm website becomes a working product: a visitor can **do** something on it, not only look at it — book, order, search, choose, take a quiz, whatever fits your topic. You decide what your visitor needs and how to build it with forms, JavaScript and jQuery.

The same topic, team and GitHub repository as in the Midterm. A new website or a new topic without the instructor's permission gets 0.

Last chance to form a team: if you worked individually, you may join a team for the Endterm and continue the website of one of its members. Tell the instructor in advance and get approval. The page minimum is then counted for the new team size.

Rules for Submission:

1. Every student gets an **individual grade**. If the works of different students or teams are the same, the grade is **0**.
2. Submit before the deadline. **Late works are not accepted!** A late submission gets 0. A student who does not defend receives 0, even if the team submitted.
3. Every member submits:
   - the project: **Endterm_FullName1_FullName2….zip**;
   - the report: **Endterm_FullName1_FullName2….docx** (or .pdf).
4. No commits after the deadline. No downloaded templates. AI tools, icons, photos and code from other sources only **with credit** on the website and in the report. Using them without credit is plagiarism, and the grade is 0.
5. IN THE REPORT MUST BE:
   - Team members and the contribution of each
   - **What is new since the Midterm** and what you fixed after the Midterm defense
   - Screenshots of the new features
   - Credits: what you used and for what
   - **The GitHub repository URL** and **the deployed website link** (e.g., GitHub Pages)

Penalties:

— the website does not open, but the code is submitted: −20%;
— a missing file, a missing link or a missing item of the report: −10% for each;
— wrong file format or name, or not ready when your name is called: −10%;
— commits after the deadline: −20%;
— fewer pages than required (see Size): −20%;
— the student cannot explain their own code (see "Defense and code quality"): −20%.

Requirements and Assessment Criteria

Size: the same as in the Midterm: at least 2 pages for 1 student; 4 pages for 2; 5 pages for 3 and 6 pages for 4. You do not have to add new pages: improve the pages you already have (you may add more if your website needs them). Every member is responsible for at least 1 page. The website must look finished: everything a visitor would expect to work must work (without a backend).

All items are minimum requirements for the pages of every student. Points are lowered for every item that is missing, does not work or looks unfinished.

№	Criterion	What is checked	Points
1	**Hosting, responsiveness and accessibility**	- opens on GitHub Pages from the same repository; no broken links, images or 404 pages - every page at 375px, 768px and 1280px: no horizontal scroll, no overlapping or cut-off elements - one navigation bar on every page, with the current page highlighted - alt text for every image; headings in order (h1 → h2 → h3); every link, button and field works with the Tab key and has a visible focus	**8**
2	**Forms and validation**	- at least 1 form that fits the website, built with Bootstrap form components, with at least 5 fields - JavaScript checks the required fields and at least 3 more rules (email, phone pattern, password length and complexity, dates, numbers…) - each error is shown under its field in clear words, not in alerts, and disappears when the field is corrected - no errors when the page opens; after a correct submit, a success message and the form is cleared	**12**
3	**JavaScript functionality**	- at least 2 interactive features that fit the website (a search, a filter, a sort, a cart with a total, a quiz with a score, a calculator, a booking…) - the content is stored in a JavaScript array of at least 8 objects (each with at least 4 properties) and created with DOM manipulation, not written by hand in HTML - your own functions, loops and conditions; at least one value is calculated (a total, a count, a score, an average…) - reacts to events (click, input, change, submit, keydown) and updates the page without reloading - handles an empty result (“nothing found”) and wrong input; every button and link works; no errors in the console	**16**
4	**jQuery effects and animations**	- at least 3 different jQuery effects that help the visitor (an accordion, a gallery, a smooth scroll, a message after the form…) - hover effects on buttons and cards - smooth; fast repeated clicks do not break or repeat them	**9**
5	**Design and user experience**	- the new parts use the same colors, fonts and spacing as the rest of the website; no default Bootstrap look - every state is designed: hover, focus, error, success, empty result - real content: no “lorem ipsum” and no placeholder images; no dead buttons, links or forms - at least one memorable solution that makes the website stand out	**10**
6	**Improvements since the Midterm and teamwork**	- every remark from the Midterm defense is fixed - visible new work on the pages of the student, listed in the report - the commit history shows regular commits by the student after the Midterm, not one commit at the end - in a team: every member made an equal contribution (a comparable part of the website and their own commits); the pages of all members look and work as one website	**15**

№	Criterion	What is checked	Points
7	**Defense and code quality (individual)**	- presents their own part clearly, confidently and within the time, without reading from notes and without searching for files - the code is organized: clear folders (css, js, images), separate JavaScript files, meaningful names, no messy, copied or unused code - explains the requested features or parts of the code in their own words and answers the instructor's questions with reasons (why this solution, what happens if…)	**30**
Total			**100**

Defense (2 minutes per student)

Every student defends individually; in a team, each member presents their own part.

1. **Presentation (1.5 minutes):** show what is new or updated since the Midterm, working live: the form, the JavaScript features, the jQuery effects and the mobile view.
2. **Questions (30 seconds):** Open the code, explain how the requested features or parts of the code work, and answer the instructor's questions.

Have the website and VS Code open before your turn. What is not shown in 2 minutes is not graded.

Good luck!
